

Plot of K_s values (vertical axis) for MSY genes and pseudogenes compared to their X homologs versus location on the MSY (horizontal axis). Gene and pseudogene names are highlighted in color to indicate whether they are in X-degenerate (yellow), X-transposed (pink), or ampliconic (blue) sequence. The positions of members of the *RBM1Y* and *OFD1P2* gene families are shown in the plot, but not along the horizontal MSY schematic at the bottom of the plot; the corresponding points in the plot are blue. The standard errors of the plotted K_s values are indicated by bars.
